Updated Heliprobe® presentation!

We have updated our Power point presentation for Heliprobe® System (see enclosure). One page has been added at the end with estimated radiation doses for different procedures, including C14-UBT, compared with natural radiation. This shows that the exposure to radioactivity when performing a Heliprobe® UBT is very small.

The dose you get from a Heliprobe® test is comparable to 20 hours of natural radiation. It is also interesting to note that a dental X-ray gives approximately the same dose. An X-ray of the digestive tract compares to 2-3 years of natural radiation.

Please use this presentation when you meet customers or organize conferences to inform about Heliprobe®.

You can find it on our web under Distributor login and here enclosed.

Best regards

KIBION
